

Q1. Accept a number from user - if it is divisible by 3 print "fun" , if it is divisible by 7 print "buzz" and if it is divisible by both(3,7) print "fun -buzz" . [Two answer]

```
import java.util.Scanner;

public class demo {

    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);
        System.out.println("enter the value");

        int n = sc.nextInt();

        if(n%3==0 && n%7==0)
        {
            System.out.print("fun -buzz");
        }
        else if(n%3==0)
        {
            System.out.print("fun ");
        }
        else if(n%7==0)
        {
            System.out.print("-buzz");
        }
    }
}
```

```
import java.util.Scanner;

public class demo {

    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        System.out.println("enter the value");

        int n = sc.nextInt();

        if(n%3==0)
        {
            System.out.print("fun ");
        }
        if(n%7==0)
        {
            System.out.print("-buzz");
        }
    }
}
```

```
    }  
}
```

Q.2 Accept a start number from user and end number from user. Print all odd number between start and end number. [Two Answer]

```
import java.util.Scanner;  
  
public class demo {  
  
    public static void main(String[] args) {  
  
        Scanner sc = new Scanner(System.in);  
  
        System.out.println("enter start value");  
        int start = sc.nextInt();  
        System.out.println("enter end value");  
        int end = sc.nextInt();  
  
        for(int i=start;i<=end;i++)  
        {  
            if(i%2!=0)  
            {  
                System.out.print(i+" ");  
            }  
        }  
    }  
}
```

```
import java.util.Scanner;  
  
public class demo {  
  
    public static void main(String[] args) {  
  
        int s=0;  
  
        if(start%2==0)  
        {  
            s++;  
        }  
  
        for(int i=start+s;i<=end;i=i+2)  
        {  
            System.out.print(i+" ");  
        }  
    }  
}
```

```

    }
}

```

Q3. Accept a number from user and check if it is palindrome number or not eg (121)

```

import java.util.Scanner;

public class demo {

    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);

        System.out.println("Enter the value");
        int k = sc.nextInt();

        int num=k;
        int rev=0;

        while(num>0)
        {
            rev=10*rev+(num%10);
            num=num/10;
        }

        if(k==rev)
        {
            System.out.println("Given number is pallindrom");
        }
        else
        {
            System.out.println("Given number is not a pallindrom");
        }
    }
}

```

Q4. Accept a term from user and print Fibonacci series.

```

import java.util.Scanner;

public class demo {

    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);
        System.out.println("Enter the value");
        int k = sc.nextInt();

```

```
int a=0;
int b=1;

int sum=a+b;

for(int i=0;i<k;i++)
{
    System.out.print(a+" ");
    a=b;
    b=sum;
    sum=a+b;

}
```

```
}
```

```
}
```
